

## Solution Architecture

|                      |                          |
|----------------------|--------------------------|
| <b>Date</b>          | 1 October 2026           |
| <b>Team ID</b>       | 62ab296c9dbd693aad5a6022 |
| <b>Project Name</b>  | Farm Management System   |
| <b>Maximum Marks</b> | 5 Marks                  |

### Solution Architecture Diagram:

Provide a high-level visual representation of your system architecture. Use the provided layout to show the main components, how they interact, and the flow of data. Include the layers (Presentation Layer, API Gateway, Core Logic, External Integrations, Data Layer) and the technologies used for each layer. Ensure the diagram is clear, well-labeled, and matches the structure shown in the example.

### Component Description Table

| Component Name     | Description (Role in Architecture)                                                                     | Technology Used                               |
|--------------------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| Presentation Layer | Provides the user interface for farmers to access and manage the system.                               | HTML, CSS, JavaScript (Responsive Web Design) |
| API Gateway        | Handles incoming requests, routes them to the core services and manages load.                          | Flask API                                     |
| Core Logic Service | Processes business logic for crops, farm activities, expenses, records, weather and market management. | Python (Flask)                                |
| Database           | Stores all application data securely.                                                                  | SQLite / MySQL                                |
